Electronic structure and bandgap of gamma-Al₂O₃:Ce compound using LDA+U exchange potential

Tuesday 05 Jul 2016 at 14:40 (00h20')

Abstract :

Gamma-Al₂O₃ is a porous metal oxide and described as a defective spinel with some cationic vacancies. In this work, we calculate the electronic density of states and band structure for the bulk of this material doped with Cerium. The calculations are performed within the density functional theory (DFT) with the Hubbard correction U (DFT+U) as implemented in the quantum ESPRESSO code. The Kohn-Sham equations are solved self-consistently, employing local density approximation (LDA) with the Hubbard U correction (LDA+U) for the exchange-correlation potential. We show that LDA+U exchange potential as a local method can predict the bandgap in a better agreement with the experiment. Our electronic structure analysis indicates that the character of the valence band maximum mainly originates from the p orbitals of the oxygen electron atoms that are close to the vacancy. The charge density results show that the polarization of the oxygen electron cloud is directed towards aluminium cations, which cause Al and O atoms to be tightly connected by a strong dipole bond. Key words: Bandgap, LDA+U exchange potential, DFT.

Award :

Yes

Level :

PhD

Supervisor :

Prof.Dejene; dejenebf@ufs.ac.za University of the Free State-QwaQwa campus

Paper :

Yes

Permission :

Yes

Primary authors : Ms. MULWA, Winfred Mueni (University of the Free State)

Co-authors : Prof. DEJENE, Francis Birhanu (University of the Free State) ; Dr. OUMA, Cecil Moro (Council for Scientific and Industrial research) ; Prof. ONANI, Martin (University of the Western Cape)

Presenter : Ms. MULWA, Winfred Mueni (University of the Free State)

Session classification : Theoretical and Computational Physics (1)

Track classification : Track G - Theoretical and Computational Physics

Type : Oral Presentation
