Quasi-free nucleon knockout contribution in $^{40}\text{Ca}(p,p')$ inclusive scattering at 200 MeV

Wednesday 10 Jul 2013 at 14:50 (00h20')

Abstract :

The Distorted Wave Impulse Approximation (DWIA) has been used to measure the extent of contributions due to quasi-free proton and neutron knockout in inclusive inelastic proton-scattering reactions from $^{40}\text{Ca}(p,2p)^{39}\text{K}$ and $^{40}\text{Ca}(p,pn)^{39}\text{Ca}$. Such reactions contribute to the underlying background in the continuum of the Isoscalar Giant Quadrupole Resonance (ISGQR) region. In the DWIA, the three-body cross-section for a reaction is considered with final relative nucleon-nucleon energy prescription (FEP) in the evaluation of cross sections. Three distorted waves are generated using different optical potentials for different channels involved. The two-body cross-section is then evaluated using on-shell amplitude interpolated from phase shifts for projectile-ejectile scattering. Quantitative description of proton and neutron contributions and the influence on the ISGQR will be discussed.
