Efficient sorting of Bessel beams

Tuesday 09 Jul 2013 at 11:30 (00h20')

Abstract :

High order Bessel beams are characterized by the azimuthal mode index, ℓ and radial component, k_r , as a result they carry orbital angular momentum (OAM) and their far-field forms an annular ring of radius, R . These beams form in a region where parallel plane waves interfere in a conical manner. A method of separating the azimuthal, ℓ and radial, k_r components of the Bessel Beams using cylindrical lenses [1] and an efficient orbital angular momentum (OAM) sorter [2] optical system is illustrated here. A conformal mapping technique [2] was used to achieve the sorting of Bessel beams, where the annular ring (Fourier transform of a Bessel beam) was mapped to a linear phase variation along the horizontal direction. A series of cylindrical lenses simultaneously Fourier transformed the transverse momentum states and imaged the unraveled annular ring to a detector plane, where the position of the detected spot is dependent on the amount of OAM it carries and its radial wave vector. Award :

Yes

Level :

MSc

Supervisor :

A. Forbes, AForbes@csir.co.za, CSIR National Laser Centre, PO Box 395, Pretoria 0001, South Africa

Paper :

No

Primary authors : Ms. MHLANGA, Thandeka (CSIR National Laser Centre)

Co-authors : Dr. DUDLEY, Angela (CSIR National Laser Centre) ; Prof. FORBES, Andrew (CSIR National Laser Centre, UKZN) ; Dr. ROUX, Stef (CSIR National Laser Centre) ; Prof. PADGETT, Miles (Department of Physics & Astronomy, University of Glasgow) ; Mr. LAVERY, Martin (Department of Physics & Astronomy, University of Glasgow)

Presenter : Ms. MHLANGA, Thandeka (CSIR National Laser Centre)

Session classification : Photonics

Track classification : Track C - Photonics

Type : Oral Presentation
