## **An all printed LRC resonant circuit**

Tuesday 08 Jul 2014 at 14:20 (00h20')

### **Abstract :**

Passive devices such as resistors, capacitors and inductors are the essential components in resonant wireless communications. Integrating these components into a resonant circuit with reduced cost using a robust method is vital for wireless sensors and radio frequency identification (RFID) technology if the “internet of Things” is to become a reality. In this work prototype LRC resonant circuits, as well as the individual components, were fabricated on paper substrates using screen printing and characterized using impedance analyzer. An air core square spiral and a parallel plate design were used for the inductor and capacitor respectively. Equivalent circuit models for the individual printed components were investigated from the fits of impedance measurement data. The results show that the printed components are equivalent to conventional discrete components and that the inductance and capacitance values were reproducible for given designs of the components.

### **Award :**

yes

### **Level :**

MSc

### **Supervisor :**

Prof David Britton, david.britton@uct.ac.za Prof Margit Harting, margit.harting@uct.ac.za University of cape town

### **Paper :**

yes

**Primary authors :** Mr. ASHEBIR, Getinet (UCT)

**Co-authors :** Dr. MANNL, Uli (UCT) ; Dr. WALTON, Stanly (UCT) ; Mr. ZAMBOU, Serges (UCT) ;  
Dr. MAGUNJE, Batsi (UCT) ; Prof. HARTING, Margit (UCT) ; Prof. BRITTON, David (UCT)

**Presenter :** Mr. ASHEBIR, Getinet (UCT)

**Session classification :** Applied

**Track classification :** Track F - Applied Physics

**Type :** Oral Presentation
