## **Prototyping automation and dynamic observing with the AuScope array**

Tuesday 15 Mar 2016 at 09:45 (00h15')

### **Content :**

The continuous observing mode envisioned for the new array of VGOS stations would benefit greatly from a high level of automation, from scheduling through to analysis. The centrally-operated AuScope VLBI array of three 12m antennas in Australia is serving as a testbed for these automation techniques. Here we describe the challenges we are addressing, how we are using simulations to understand where the most beneficial improvements can be obtained (in dynamic scheduling for example) and present the progress we have already made.

**Primary authors :** Dr. LOVELL, Jim (University of Tasmania)

**Co-authors :** Dr. PLANK, Lucia (University of Tasmania) ; Mr. MAYER, David (Technische Universität Wien) ; Dr. MCCALLUM, Jamie (University of Tasmania) ; Dr. SHABALA, Stanislav (University of Tasmania)

**Presenter :** Dr. LOVELL, Jim (University of Tasmania)

**Session classification :** Oral2: VGOS Strategies and Expected Results

**Track classification :** 2: VGOS Strategies and Expected Results

**Type :** Oral Presentation
