

Structural Biology at the ESRF: present and future

Tuesday, 12 November 2019 14:00 (30 minutes)

The ESRF's facilities for Structural Biology comprise 6 end-stations for macromolecular crystallography (MX) 1, one end-station for BioSAXS experiments 2 and one end-station based around a Titan Krios cryo-electron microscope 3. These are supplemented by a number of support laboratories including the iCOS facility for in crystallo optical spectroscopy 4 and a facility for the high pressure cryo-cooling and/or derivatisation of crystals of biological macromolecules 5. This talk will describe the instrumentation and experimental possibilities available on these end-stations, with a particular emphasis on automation, remote access and mail-in services.

The ESRF Extremely Brilliant Source (EBS) project (see <http://www.esrf.fr/about/upgrade> for details) will provide benefits for many areas of synchrotron-based science. This presentation will thus also look ahead to the evolution of the ESRF's facilities for Structural Biology post-2020, focusing on the possibilities for serial crystallography and time-resolved MX, which ESRF-EBS X-ray beams will facilitate.
