Electrical and magnetic properties of NdAuGe compound

Tuesday, 9 July 2013 17:40 (1 hour)

Abstract content
 (Max 300 words)

We report the electrical and magnetic properties of the hexagonal NdAuGe, through the measurement of X-ray diffraction (XRD), electrical resistivity ($\rho(T)$), magnetic susceptibility ($\chi(T)$) and magnetization ($M(H)$). XRD data indicate a hexagonal NdPtSb-type structure with space group $P6_3mc$. Result of electrical resistivity shows a metallic – like behavior below 150 K and a broad curvature above 150 K. The low temperature $\chi(T)$ data indicate the onset of a magnetic transition. $\chi(T)$ data at low temperature in zero field-cooled (ZFC) indicates a magnetic phase transition at temperature $T_N = 7.8$ K. The high temperature $\chi(T)$ data follow the Curie – Weiss relation and give effective moment value μ_{eff} slightly reduced from the expected value $3.62 \mu_B$ of the free Nd^{+3} -ion. ZFC and FC (field cooling) $\chi(T)$ shows a bifurcation below $T_f = 13$ K.

Apply to be
 considered for a student
 award (Yes / No)?

yes

Level for award
 (Hons, MSc,
 PhD)?

PhD

Main supervisor (name and email)
and his / her institution

Prof Moise Tchoula Tchokonte / University of the Western Cape

Would you like to
 submit a short paper
 for the Conference
 Proceedings (Yes / No)?

Yes

Primary author: Mr BASHIR, Aiman (University of Western Cape)

Co-authors: Prof. STRYDOM, Andre (University of Johannesburg); Mr SNYMAN, Jasper (University of Johannesburg); Prof. TCHOULA TCHOKONTE, Moise (University of the Western Cape)

Presenter: Mr BASHIR, Aiman (University of Western Cape)

Session Classification: Poster1

Track Classification: Track A - Division for Condensed Matter Physics and Materials
