Synthesis and magnetic characterizations of $\text{Mn}_x\text{Fe}_{3-x}\text{O}_4$ nanoferrites

Tuesday, 9 July 2013 17:40 (1 hour)

Abstract content
 (Max 300 words)

Manganese ferrite nanoparticles with in steps of 0.1 have been produced using the glycol-thermal method at 200 °C. Single-phase formation was confirmed by X-ray powder diffraction (XRD) which revealed a well-defined cubic spinel structure with space group $\text{Fd}\bar{3}\text{m}$. structure parameters were also estimated from XRD data. Average crystallite sizes ranged from 8.91 to 9.77 nm. The Vibrating sample magnetometer measurements show that the produced nanoparticles exhibit superparamagnetic behavior at room temperature. Magnetic properties as a function of the manganese content measured at 300 K were also investigated. The Fe^{3+} ions distributions among tetrahedral and octahedral sites, hyperfine parameters and magnetic state of the as-prepared samples were studied using ^{57}Fe Mössbauer spectroscopy technique.

Apply to be
 considered for a student
 award (Yes / No)?

No

Level for award
 (Hons, MSc,
 PhD)?

PhD

Main supervisor (name and email)
and his / her institution

Dr. Thomas Moyo

Would you like to
 submit a short paper
 for the Conference
 Proceedings (Yes / No)?

Yes

Primary author: Dr ABDALLAH, Hafiz M I (University of KwaZulu-Natal)

Co-authors: Mr MASINA, Patrick (University of KwaZulu-Natal); Dr MOYO, Thomas (University of KwaZulu-Natal)

Presenter: Dr ABDALLAH, Hafiz M I (University of KwaZulu-Natal)

Session Classification: Poster1

Track Classification: Track A - Division for Condensed Matter Physics and Materials
