A low band gap copolymer (Eg= 1.6.eV) with bithiophene as a donor and isoindigo as an acceptor units was designed and synthesized by direct heteroarylation method. Absorbance of the polymers spans from 300nm to 780nm with a deeper HOMO level of -5.42eV and LUMO level of -3.72eV. It exhibits absorption coefficient (ε) as high as 96 L/g cm in solution at its maxima. Steady state spectroscopy measurements showed solvent polarity independent absorption but the emission spectra was red shift with increasing solvent polarity. Femtosecond-transient absorption measurement in solution showed the presence of intramolecular charge transfer state (ICT) in the relaxation of the polymer in monodisperse system. The intersystem conversion to generate the ICT state was as fast as 2ps. Inverted ITO free solar cells were prepared in bulk heterojunction with PCBM71 and moderate efficiency of 1.02% with high open circuit voltage of 0.81V was obtained.

Apply to be
 considered for a student
 award (Yes / No)?

yes

Level for award
 (Hons, MSc,
 PhD, N/A)?

PhD

Main supervisor (name and email)
and his / her institution

Heinrich Schwoerer

Would you like to
 submit a short paper
