Using available TEC data derived from GPS stations within the entire African sector, a regional empirical model for TEC predictions was developed based on the Empirical Orthogonal Functions (EOF). The regional TEC data was first decomposed in terms of EOF base functions and associated coefficients and a system of coordinates that changes with location was adopted: local time and modified dip latitude, to allow the base functions to change from location to location. Thereafter, the EOF coefficients were estimated in terms of the global indices F10.7p, Ap, Dst and AE in order to take into account the solar and geomagnetic activities. The model validation will be done by comparing the reconstructed and observed TEC.

Apply to be
 considered for a student
   award (Yes / No)?

Yes

Level for award
 (Hons, MSc,
   PhD, N/A)?

PhD

Main supervisor (name and email)
and his / her institution

Dr John Bosco Habarulema
jhabarulema@sansa.org.za
SANSA Space Science

Would you like to <br> submit a short paper <br> for the Conference
 Proceedings (Yes / No)?

No

Please indicate whether
this abstract may be
published online
(Yes / No)

Yes

Primary author: Mr UWAMAHORO, Jean Claude (SANSA Space Science, Rhodes University)

Co-author: Dr HABARULEMA, John Bosco (SANSA Space Science, Rhodes University)

Presenter: Mr UWAMAHORO, Jean Claude (SANSA Space Science, Rhodes University)
Session Classification: Space Science

Track Classification: Track D2 - Space Science
