SAIP Conference, UCT, July 2016

Outline

1 Motivation

2 Samples

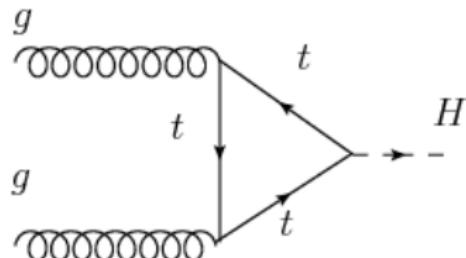

3 Selection

4 Cutflows

5 Summary

Motivation

- Model developed requires H be produced primarily through ggF and decay to hh , VV and $h\chi\chi$

- Embedding H into a 2HDM beckons a new search channel:

$$pp \rightarrow A \rightarrow ZH$$

implying a search channel for large mass A , for hypothesized pseudo-scalar A .

- The large $H \rightarrow h\chi\chi$ and $h \rightarrow b\bar{b}$ branching ratios open up the $Vh + E_T^{\text{miss}}$ channels

Signal and Background

- Signal decays as $pp \rightarrow A \rightarrow l^\pm l^\mp b\bar{b} + E_T^{miss}$, for l^\pm either μ^\pm or e^\pm

$$pp \rightarrow A \rightarrow ZH$$

$$Z \rightarrow l^+ l^-, H \rightarrow h\chi\chi$$

$$h \rightarrow b\bar{b}$$

- Background decays as given in samples ran over

Samples

The samples ran over were

- Single Top
- Diboson
- $W + \text{jets}$
- $Z + \text{jets}$
- $t\bar{t}$

Selection

The preselections are as follows:

- $ee/\mu\mu$ ($e\mu/\mu e$) final states + b-jets
- Exactly two oppositely charged leptons with $p_T > 25$ GeV
- $Z \rightarrow ll$ region for $70 < m_{ll} < 110$ GeV
- At least two central jets
- $E_T^{miss} > 100$ GeV
- $\Delta\phi(j1, E_T^{miss}) > 0.5$
- $\Delta\phi(j2, E_T^{miss}) > 0.5$
- B-tagging is done to all selected central jets
- In the 1 b-tag Category, we have *exactly* one b-jet
- In the 2 b-tag Category at least one of the b-jets must have $p_T > 45$ GeV
- MC comparison presented

$ee/\mu\mu$: At least 2 b jets

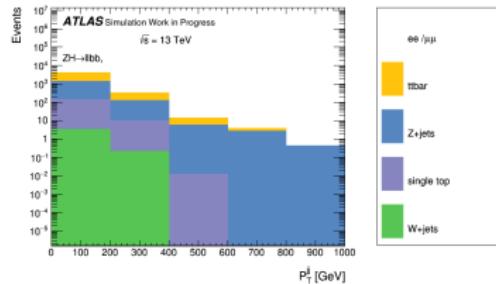

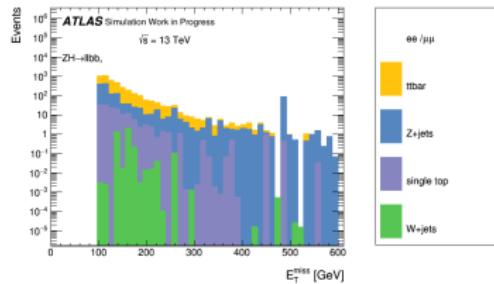

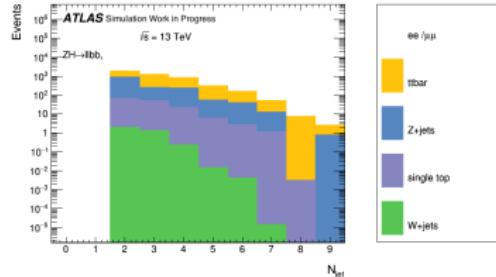

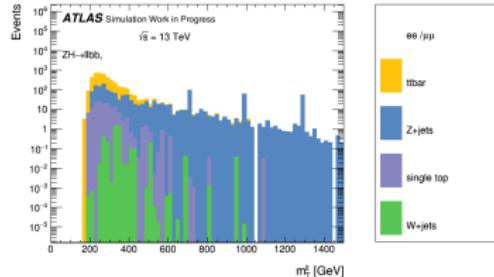

$ee/\mu\mu$: Exactly 1 b jet

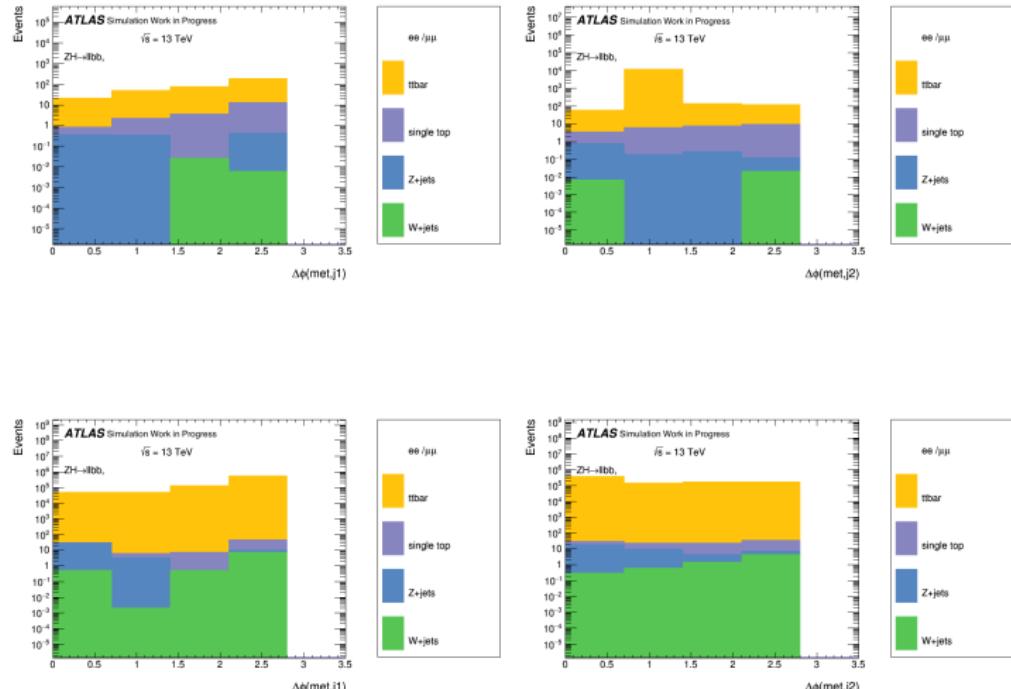

$ee/\mu\mu$: Exactly 2 b jets

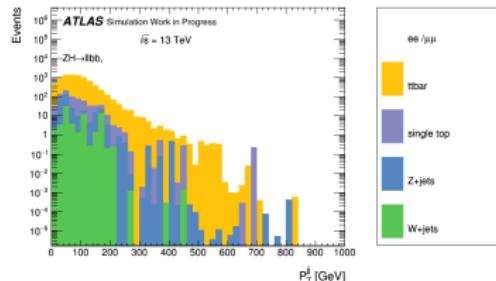

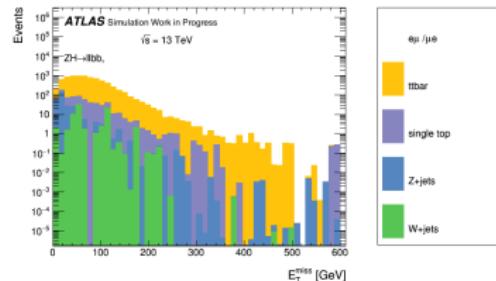

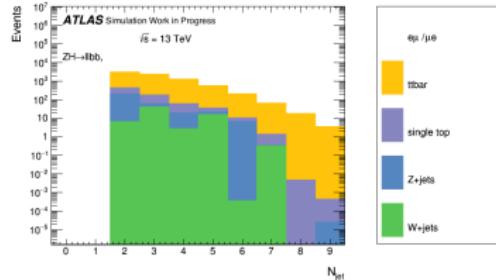

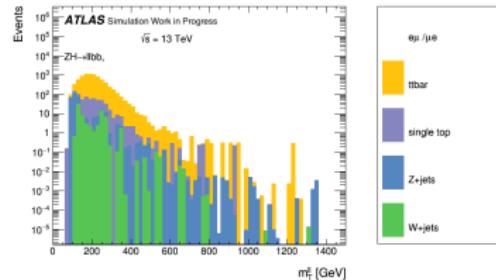

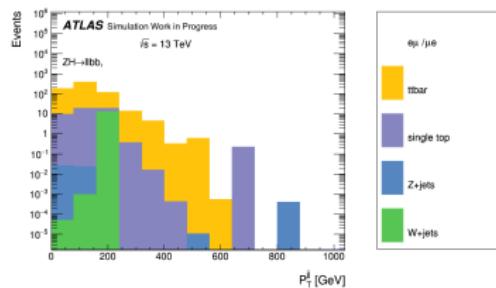

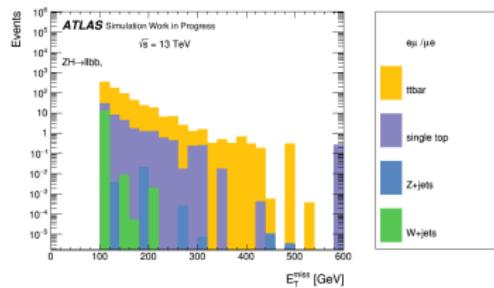

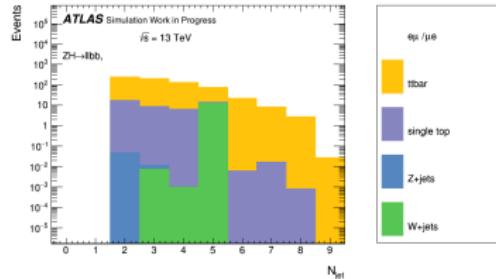

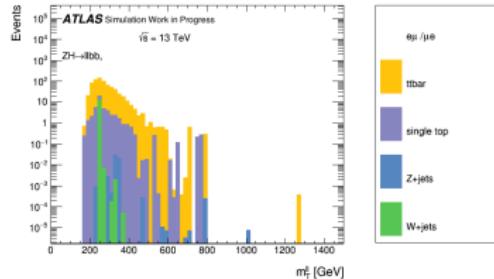

$ee/\mu\mu: E_T^{miss} > 100 \text{ GeV}$

$ee/\mu\mu$: $\delta\phi$ for 2 b jets and $E_T^{miss} > 100 \text{ GeV}$

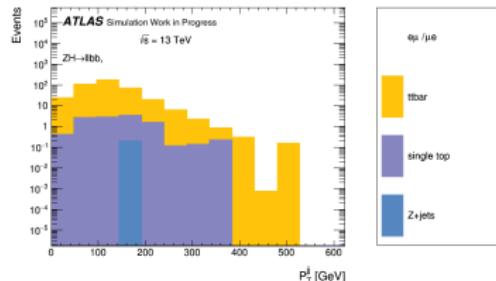

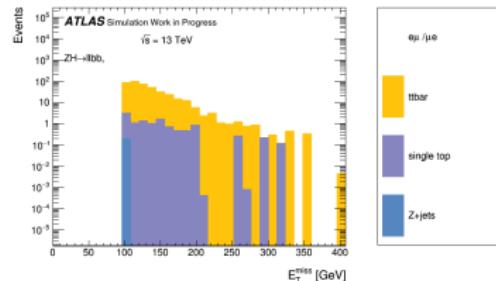

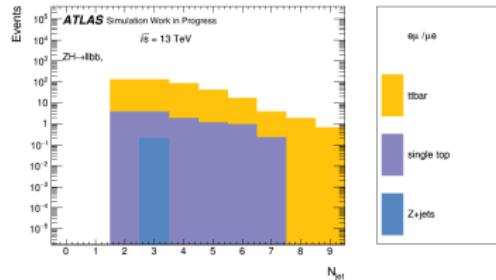

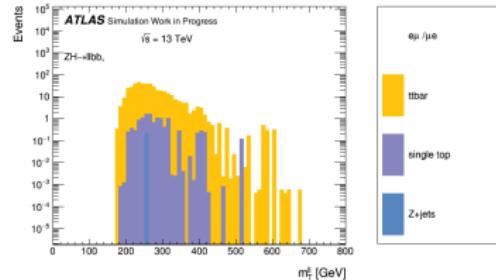

$e\mu/\mu e$: At least 2 jets

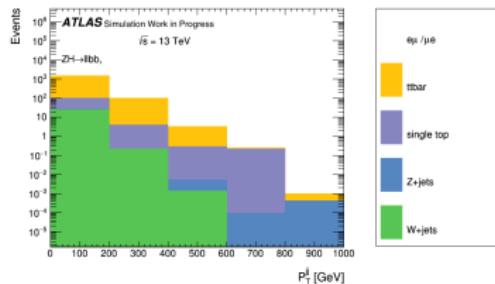

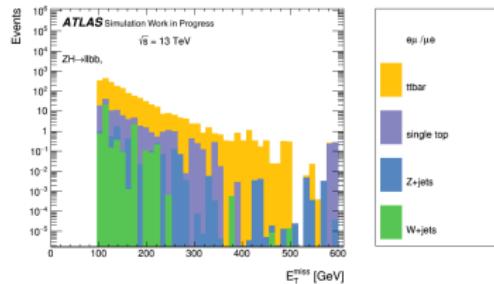

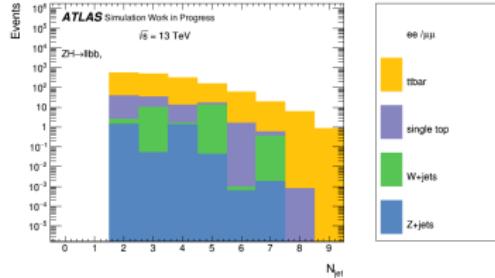

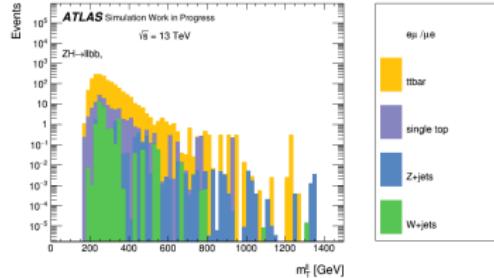

$e\mu/\mu e$: Exactly 1 b jet

$e\mu/\mu e$: Exactly 2 b jets

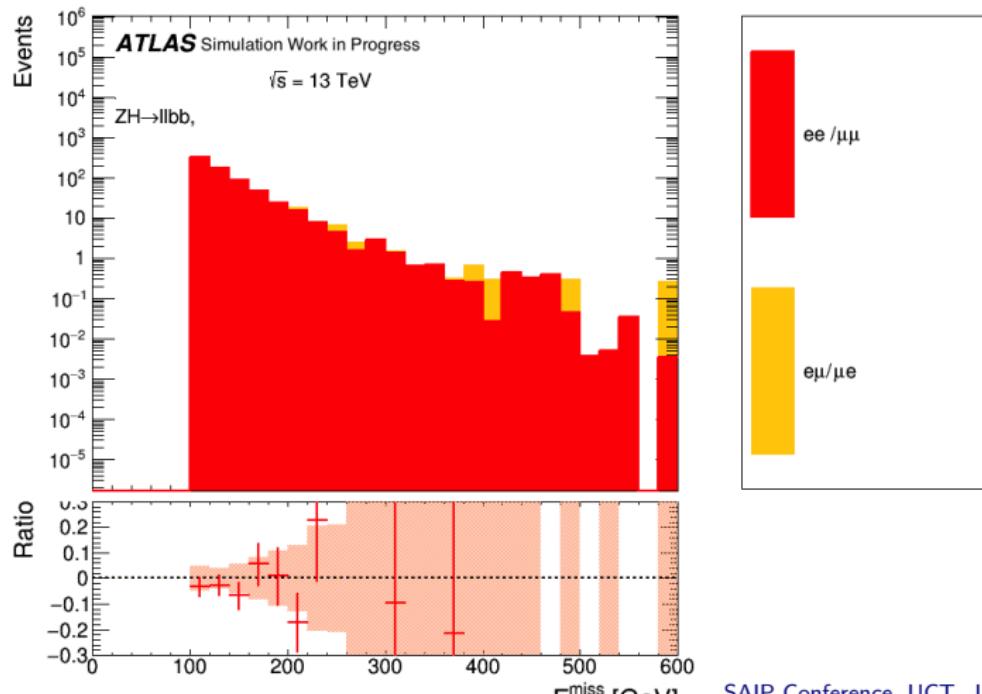

$e\mu/\mu e$: $E_T^{miss} > 100 \text{ GeV}$

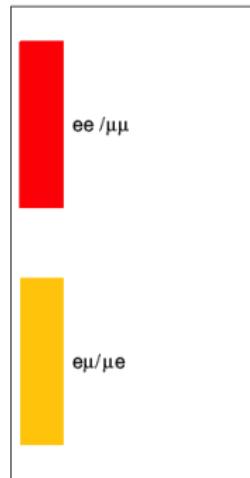

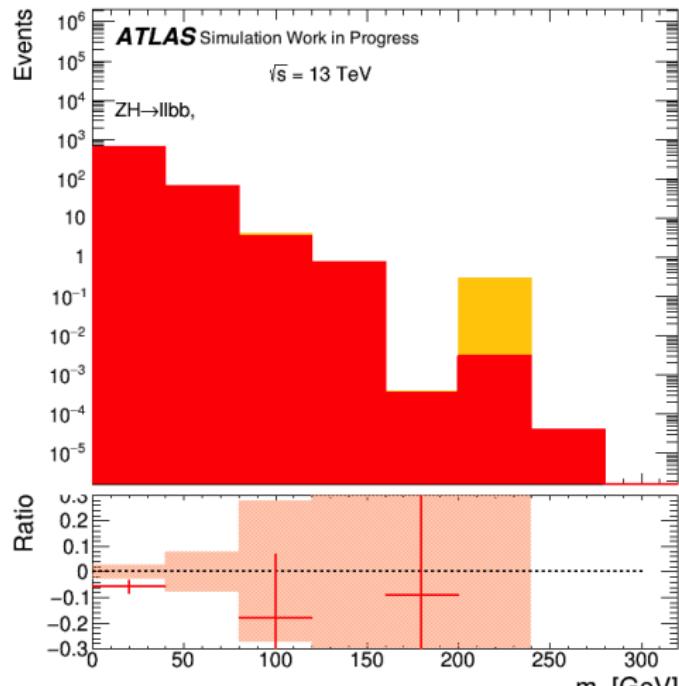

Comparison Distributions

$E_T^{miss} > 100 \text{ GeV}$

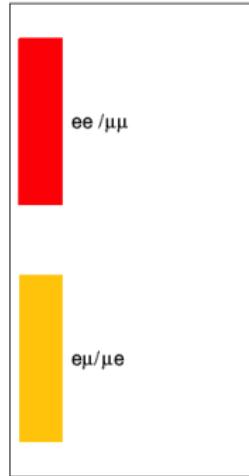

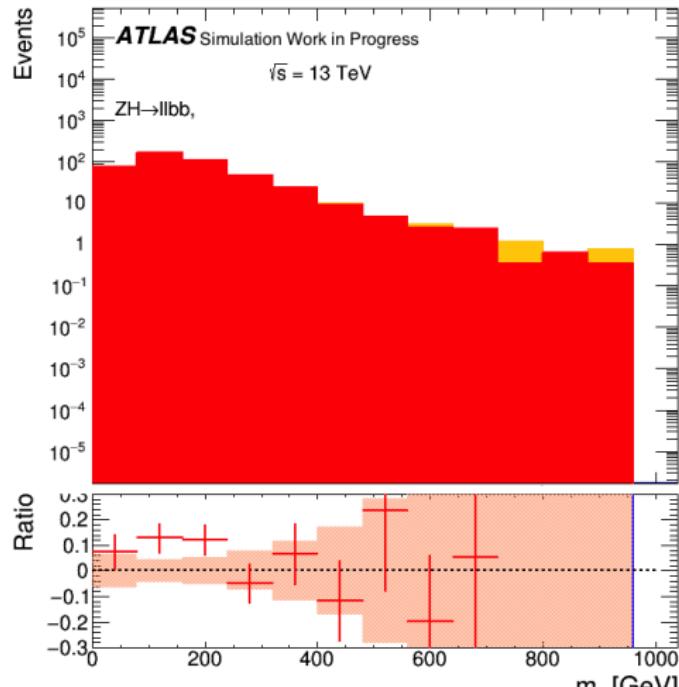

Comparison Distributions

Exactly 1 b jet

Comparison Distributions

Exactly 2 b jets

Summary

- Additional selections have suppressed the z+jets Bkg
- Very few statistics after 2 b cut
- Idea is to show that if the m_{jj} distributions for the $ee/\mu\mu$ and $e\mu/\mu e$ case are almost the same, then we can use a data driven method to predict the shape of m_{jj}
- This shows how to extract the top background
