63rd ANNUAL CONFERENCE OF THE SA INSTITUTE OF PHYSICS

Contribution ID: 158

Type: Oral Presentation

Synthesis of MXene nanoribbons with Onion-like carbons for supercapacitors

Wednesday, 27 June 2018 14:40 (20 minutes)

A new family of 2D materials called MXenes have recently been discovered, which can be synthesized from MAX phases via chemical etching of the A group elements. The properties of MXenes can be tuned by changing their terminal functional groups, and they further allow for the easy creation of thin films, increasing their versatility. Their 2D structure allows for fast redox reactions at their surface, which creates an excellent candidate for supercapacitor electrode material for high power density applications. We doped Ti2C with onion-like carbons, a material known for excellent conductivity and highly accessible surface area, and studied its physical properties as a cathode for applications in supercapacitor storage. We will further comment on its applicability in conjunction with photovoltaic panels.

Please confirm that you
have carefully read the
abstract submission instructions
under the menu item
"Call for Abstracts"
<b/(Yes / No)

Yes

Consideration for
student awards
Choose one option
