Equilibration of hot and dense nuclear matter

Friday, 13 July 2012 08:00 (20 minutes)

Abstract content
 (Max 300 words)

We perform a Monte Carlo calculation for a system which resembles an equilibrated hadronic gas in a box using a Ultra-relativistic Quantum Molecular Dynamics. We calculate spectra, multiplicity, and rapidity for various hadrons at different energy densities. The particle multiplicity equilibrate after some time, rapidity distribution is isotropic and the energy spectra of the different hadronic species are fitted by a Boltzmann distribution. Thus, indicates that system is in equilibrium.
