Angular self reconstruction

Thursday, 12 July 2012 16:40 (20 minutes)

Abstract content
 (Max 300 words)

In this work we report a new effect, namely, an angular self reconstruction of beams which carry no angular momentum. This effect can be monitored in beams which can be decomposed as a sum of beams which carry angular momentum. We have investigated in detail the self reconstruction effect and have determined the parameters which influence the self reconstruction distance.
