Modification of glassy carbon under strontium ion implantation

Tuesday, 10 July 2012 17:30 (2 hours)

Abstract content
 (Max 300 words)

The structural changes of glassy carbon (Sigradur® G) due to implantation with 360 keV strontium ions at room and high temperatures are reported. The samples were implanted with strontium ions at a fluence of 2×10¹⁶ ions/cm² at room temperatures, 350 deg;C and 600 deg;C. The influence of ion implantation on surface morphology and topology was examined by the scanning electron microscopy (SEM) and atomic force microscope (AFM). Raman spectroscopy and X-ray diffraction were used to monitor the structural changes induced in glassy carbon as a result of implantation. The depth profiles of the strontium implanted at different temperatures we determined by Rutherford backscattering (RBS).
