Synthesis and characterization of SnO_2 Nanostructures for gas sensing applications

Wednesday, 11 July 2012 11:35 (20 minutes)

Abstract content (Max 300 words)

Tin oxide (SnO_2) is an important wide-bandgap (3.6 eV) n-type semiconductor with a rutile structure which has received a great deal of attention over the past few years due to its high transparency in the visible part of the spectrum, structural and chemical stability. It has been investigated for advanced functional use such as solid state gas sensors, transparent conductors, oxidation catalysts and optoelectronic devices [1-4]. In this work we report on the successful formation of SnO_2 nanostructures by using the Chemical vapour deposition process. As synthesized SnO_2 samples were characterized using scanning electron microscopy (SEM), X-ray powder diffraction (XRD), and nitrogen adsorption analysis (BET). X-ray analysis of the tin oxide nanomaterial showed a highly, pure crystalline material

Apply to be considered for a student award (Yes / No)?

yes

Level for award (Hons, MSc, PhD)?

Msc

Main supervisor (name and email) and his / her institution

gerald malgas, Gmalgas@csir.co.za

Would you like to submit a short paper for the Conference Proceedings (Yes / No)?

no

Primary author: Mr THABETHE, Bongani (Msm csir)

Presenter: Mr THABETHE, Bongani (Msm csir)

Session Classification: DCMPPM1

Track Classification: Track A - Division for Condensed Matter Physics and Materials
