

African Synchrotron Network for Advanced Energy Materials

Monday, 11 November 2019 14:15 (15 minutes)

New materials for the capture of light and mechanical energy can potentially enable low-cost and innovative renewable sources of energy while eliminating negative effects on the environment that are inherent when non-renewable sources of energy are utilised. Energy materials characterisation with synchrotron x-rays is a vital tool for the development of modern and next generation energy harvesting and storage technologies. The advent of the first African Light Source (AfLS) has the potential to transform the energy materials and related technology industries that underpin a robust and sustainable economy. The ASNAEM project aims to expand the local knowledge base and build capacity in the existing synchrotron community in preparation for the AfLS. It will enable sustainable partnerships that extend beyond the lifetime of the project. In this talk, I will discuss the activities of the ASNAEM project and our vision for synchrotron science at the AfLS.

Primary author: Dr NEWTON, Marcus (University of Southampton)

Co-authors: Prof. QUANDT, Alex (University of the Witwatersrand); Prof. AMUZUVI, Christian (University of Mines and Technology, Ghana); Prof. MWABORA, Julius (University of Nairobi); Prof. NAIDOO, Mervin (University of the Witwatersrand); Dr NGABONZIZA, Prosper (Max Planck Institute for Solid State Research); Prof. CONNELL, Simon (University of Johannesburg)

Presenter: Dr NEWTON, Marcus (University of Southampton)

Session Classification: Strategy 1

Track Classification: Strategy
