A multi-band view on the evolution of group central galaxies

Tuesday, 27 July 2021 12:45 (15 minutes)

Much of the evolution of galaxies takes place in groups that occupy the interesting intermediate-mass range, where feedback has the greatest impact on galaxy formation and evolution. By using multi-band data (FUV, Mid-IR, Radio, CO, and X-rays), and an optically selected, statistically complete sample of 53 groups (< 80 Mpc; CLoGS sample) the galaxy evolution and star-formation activity of the central group dominant early-type galaxies is examined in relation to their gas content, AGN activity and local environment. The majority of the group dominant galaxies (87%; 41/47) are found to be passive systems without any significant star-forming activity, with the rest of the highest star-forming systems found to present significant cold gas detections, residing in X-ray faint groups (X-ray halo <65 kpc) and none hosting a powerful radio source ($P_{1.4\text{GHz}} > 10^{23}$ W/Hz). As galaxy groups are a favorable environment for both cooling flows and gas-rich galaxy mergers and interactions, the significant role of both processes on the origin of cold gas and the fuelling of an AGN or star-formation will be discussed along with results on the properties of the highest star-forming systems and the implications on AGN feedback in galaxy groups.

Apply to be considered for a student ; award (Yes / No)?

No

Level for award;(Hons, MSc, PhD, N/A)?

N/A

Primary author: KOLOKYTHAS, Konstantinos (North-West University)

Co-authors: Prof. LOUBSER, Ilani (North-West University); Dr O'SULLIVAN, Ewan (Harvard-Smithsonian Center for Astrophysics); Dr VADDI, Sravani (Arecibo Observatory); Prof. RAYCHAUDHURY, Somak (IUCAA); Prof. BABUL, Arif (University of Victoria)

Presenter: KOLOKYTHAS, Konstantinos (North-West University)

Session Classification: Astrophysics

Track Classification: Track D1 - Astrophysics
