Machine learning approach for the search of resonances with topological features at the Large Hadron Collider

Friday, 30 July 2021 12:30 (15 minutes)

We propose a new approach to search for new resonances beyond the Standard Model (SM) of particle physics in topological configurations using Machine Learning techniques. This involves a novel classification procedure based on a combination of weak-supervision and full-supervision in conjunction with Deep Neural Network algorithms. The performance of this strategy is evaluated on the production of SM Higgs boson decaying to a pair of photons inclusively and exclusive regions of phase space, for specific production modes at the Large Hadron Collider (LHC), namely through the gluon-gluon fusion, the fusion of weak vector bosons, in associated production with a weak vector boson, or in association with a pair of top quarks. After verifying the ability of the methodology to extract different Higgs signal mechanisms, a search for new phenomena in high-mass diphoton final states is setup for the LHC.

Apply to be considered for a student ; award (Yes / No)?

Yes

Level for award;(Hons, MSc, PhD, N/A)?

PhD

Primary author: DAHBI, Salah-eddine (University of Wits)

Co-authors: LIEBERMAN, Benjamin (University of Witwatersrand); MELLADO, Bruce (University of the Witwatersrand); MOKGATITSWANE, Gaogalalwe (University of the Witwatersrand (ZA)); Mr CHOMA, Joshua (University of the Witwatersrand); RUAN, XIFENG (University of the witwatersrand)

Presenter: DAHBI, Salah-eddine (University of Wits)

Session Classification: Nuclear, Particle and Radiation Physics

Track Classification: Track B - Nuclear, Particle and Radiation Physics
