

# Multi-fluid Perturbations of Cosmology in $f(T)$ -gravity Model July, 2023, SAIP

Shambel Sahlu and Amare Abebe

North-West University, Potchefstroom, South Africa

# Talk's Plan

- 1 Introduction
  - Multi-fluid Cosmology
- 2 Multi-fluid Cosmology in  $f(T)$ -gravity model
- 3 Results

## Why gravity?

**“It’s the gravity that shapes the large scale structure of the universe, even though it is the weakest of four categories of forces”** Stephen Hawking.

## Introduction of the theory of gravity

The physics of gravity is completely changed after the development of general theory of relativity

$$G_{\mu\nu} = R_{\mu\nu} - \frac{1}{2}g_{\mu\nu}R = \frac{8\pi G}{C^4}T_{\mu\nu} \quad (1)$$

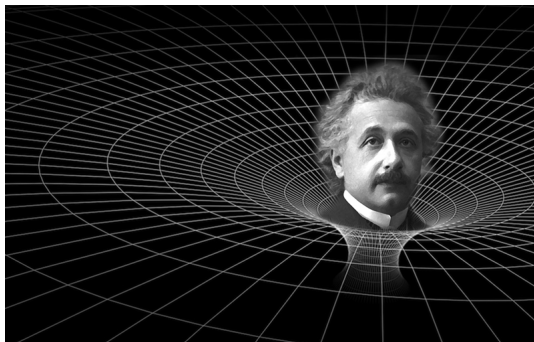

Figure 1: Space-time curvature

# Introduction Cosmology

- It deals about origin of the universe, the formation large-scale structures and dynamics, and the ultimate fate of the universe.

Figure 2: A history of the Universe. Credit: [grandunificationtheory.com](http://grandunificationtheory.com)

- **Standard model of cosmology**
  - ① Isotropic
  - ② Homogeneous
- **Cosmological probs:** Dark matter, , Inflationary Universe  
....
- **Why the modified theory of gravity is needed?**

## Modified theory of gravity

- The standard model of cosmology so-called  $\Lambda$ CDM model is going to be a big challenge due to the presence of the most extremely dramatic behavior of the universe.
- For instance, the discovery of dark energy and dark matter still becomes a puzzle in physics.
- Dark energy responsible for current accelerating expansion universe.
- To solve such kind of probes in cosmology, the modification of the general theory of gravity count as an alternative approach to explain the acceleration expansion universe without dark energy scenarios.
- There are many modified theories of gravity, such as:
  - Gauss Bonnet  $f(G)$ ,  $G$ -being the universal gravitational constant,
  - $f(R)$ ,  $R$ -being scalar curvature ,
  - $f(T)$ ,  $T$ -being torsion scalar and  $f(T, B)$ ,  $B$ -being the boundary term.

## $f(T)$ -gravity

- In this talk, the second-order gravity so called  $f(T)$ -gravity only considered.
- In GR, torsion  $T$  is assumed to vanish and in **teleparallel gravity theory**, curvature  $R$  is assumed to vanish.
- Fortunately, the two basic theories of gravity describe the gravitational interaction equivalently TEGR.
- So, torsion is an alternative direction of describing the gravitational field interaction the energy-momentum tensor is the source in both theories the source of the curvature in GR and the source of torsion in teleparallel gravity theory
- One of the basic differences from the usual internal gauge models in many ways, the most significant being the presence of a tetrad field.

- In teleparallel gravity theory, we use the new connection which is **Weitzenböck** connection instead of the usual **connection affine or Levi-Civita connection**, and we use the torsion scalar  $T$  to describe the Lagrangian density rather than curvature scalar  $R$ .
- Ricci scalar yields as

$$R = T + 2\nabla^a T_{ab}{}^b = T + 2\nabla^a T_a, \quad (2)$$

$$= T + B, \quad (3)$$

where  $T_a = T_{ab}{}^b$  and  $B = 2\nabla^a T_a$  is the boundary term.

- Then Eq. (3) gives us a clear hint on how we can explore the relationship between  $R$  and  $T$ .

# Universe Compositions

**Figure 3:** Energy content of the universe according to the standard model of particle physics and general relativity. **Sources:** Max-Planck-Institute for Astrophysics Garching and Pixabay

- Our universe is composed of many fluids namely, radiation, baryonic matter, dark matter, etc... and in most cases they interact with each other.
- In this work, we consider the growth of matter density with cosmic time if the universe has multi-fluid systems.
- In this assumptions the Universe has filled by  $i^{th}$ -component non-interacting fluids and the total energy-momentum tensor of the fluid becomes the sum of the individual spices,

$$\Theta_{ab}^{total} \equiv \sum_i \Theta_{ab}^i = \rho_i u_a^i u_b^i + p_i h_{ab}^i + q_a^i u_b^i + q_b^i u_a^i + \pi_{ab}^i \quad (4)$$

where  $\rho_i$  is the energy density,  $p_i$  is the pressure,  $q_i$  is the heat flux and  $\pi_i$  is the anisotropic stress tensor of the  $i^{th}$  fluids.

- So far, the four-velocity vector is either energy frame  $u_a^i = u_{aE}^i$  or particle frame  $J_a^i = J_{aN}^i = 0$  for component fluids [1].
- Then, the inhomogeneity variables the spatial gradient of gauge invariant quantities in  $i^{\text{th}}$ -component fluids express as follows:

$$D_m^i = \frac{a}{\rho_m^i} \tilde{\nabla}_a \rho_m^i, \quad Z_a = a \tilde{\nabla}_a \theta, \quad (5)$$

$$Y_m^i = \tilde{\nabla}_a p_m^i, \quad \epsilon_a^i = \frac{a}{p_m^i} \frac{\partial p_m^i}{\partial \rho_m^i} \tilde{\nabla}_a s^i. \quad (6)$$

The physical parameter  $\epsilon_a$ , is the dimensionless quantities that represent the entropy perturbations for  $i^{th}$ -component fluids. The expression of this dimensionless parameter with pressure can be expressed as [1]

$$p\epsilon_a = \sum_i p_i \epsilon_a^i + \frac{1}{2} \sum_{i,j} \frac{h_i h_j}{h} (c_{si}^2 - c_{sj}^2) S_a^{ij}, \quad (7)$$

where  $w_i = \frac{p_i}{\rho_i}$  is equation of state parameter and  $c_{is}^2 = \frac{\partial p_i}{\partial \rho_i}$  is sound speed for the  $i^{th}$ -component fluids. The conservation equation for the  $i^{th}$  components of non-interacting fluids as [1, 2]

$$\dot{\rho}_i + h_i \theta + h_i \tilde{\nabla}^a \Psi_a^i = 0, \quad \text{since} \quad h_i = \rho_i + p_i, \quad (8)$$

and

$$h_i \dot{u}_a + \tilde{\nabla}_a p_i + h_i \dot{\Psi}_a^i - (3c_{si}^2 - 1) \frac{\theta}{3} \Psi_a^i + \Pi_a^i = 0, \quad (9)$$

where

$$\Psi_a^i = \frac{q_a^i}{h_i} + V_a^i, \quad \Pi_a^i = \tilde{\nabla}^b \pi_{ab}^i, \quad (10)$$

the term  $V_a^i$  is the relative velocity of the  $i^{\text{th}}$  component fluids which is relative to the fundamental observer.

For the case of perfect fluids, the heat flux and anisotropic stress are going to zero and  $\Psi_a^i = V_a^i$ . The relative velocity of the  $i^{\text{th}}$  component fluid to the fundamental observer  $O_u$  can be defined as

$$V_a^i \equiv u_a^i - u_a. \quad (11)$$

The detailed analysis of cosmological perturbations in multi-component fluids is done for GR approach [3, 1] and  $f(R)$  approach [2].

- In the present work we extend this investigation in  $f(T)$  gravitational theory and we discuss the cosmological perturbations for multi-fluid systems and their cosmological implications.
- Then, the general form of the linear evolution equations for total fluids in  $f(T)$  gravity theory by  $1 + 3$  covariant formalism is presented in Eqs. (5)- (9) as:

$$\dot{D}_a^m = -(1+w)Z_a + \theta w D_a^m + w\theta \varepsilon_a, \quad (12)$$

$$\begin{aligned} \dot{Z}_a = & \left[ - \left( \frac{3\rho_m}{2f'} + \frac{3w}{2f'} \rho_m \right) + \left[ \frac{\theta^2}{3} + \frac{1}{2f'} (1+3w) \rho_m \right. \right. \\ & \left. \left. + \frac{f''}{f'} \dot{T}\theta - \tilde{\nabla}^2 \right] \frac{c_s^2}{1+w} \right] D_a^m \\ & - \left[ \frac{\rho_m f''}{2f'^2} + \frac{3wf''}{2f'^2} \rho_m + \frac{f'''}{f'} \dot{T}\theta + \frac{f''^2}{f'^2} \dot{T}\theta \right] \mathcal{F}_a - \frac{f''}{f'} \theta \mathcal{B}_a \\ & - \left( \frac{f'' \dot{T}}{f'} + \frac{2\theta}{3} \right) Z_a \\ & + \left[ \frac{\theta^2}{3} + \frac{1}{2f'} (1+3w) \rho_m + \frac{f''}{f'} \dot{T}\theta - \tilde{\nabla}^2 \right] \frac{w\varepsilon_a}{1+w}, \quad (13) \end{aligned}$$

$$\dot{\mathcal{F}}_a = \mathcal{B} - \frac{\dot{T}}{1+w} (c_s^2 D_a^m + w\varepsilon_a), \quad (14)$$

## Evolution equations for component fluid

- Another key points in a multi-fluid system are the matter component and velocity fluctuations.
- These equations are useful to study the growth of energy density fluctuations for  $i^{th}$ -component fluids. Then the first-order spatial gradient equation for matter component fluid from Eq. (5) and velocity fluctuations from Eq. (9) respectively

$$\begin{aligned} \dot{D}_a^i = & -(1 + w_i)Z_a + \frac{1 + w_i}{1 + w} \theta (c_s^2 D_a^m + w\varepsilon) - \theta w_i D_a^i - \theta c_{si}^2 D_a^i \\ & - \theta w\varepsilon - (1 + w_i)a \tilde{\nabla}_a \tilde{\nabla}_b V_i^b, \end{aligned} \quad (16)$$

$$\dot{V}_a^i - (3c_{si}^2 - 1) \frac{\theta}{3} V_a^i = -\frac{1}{ahh_i} \left( (hc_{si}^2 D_a^i \rho_i + hp_i \varepsilon_a) - h_i c_s^2 D_a \rho - h_i p \varepsilon_a \right)$$

## Applied some techniques

### Scalar Decomposition techniques

$$\Delta_m = a \tilde{\nabla}^a D_a^m, \quad Z = a \tilde{\nabla}^a Z_a, \quad \mathcal{F} = a \tilde{\nabla}^a \mathcal{F}_a, \quad \mathcal{B} = a \tilde{\nabla}^a \mathcal{B}$$

$$S_{ij} = a \tilde{\nabla}^a S_a^{ij}, \quad V_{ij} = a \tilde{\nabla}^a V_a^{ij}, \quad \Delta_m^i = a \tilde{\nabla}^a D_a^i, \quad V_i = a \tilde{\nabla}^a V_a^i$$

### Harmonic Decomposition Technique

$$X = \sum_k X^k(t) Q^k(\vec{x}), \quad \text{and} \quad Y = \sum_k Y^k(t) Q^k(\vec{x}),$$

where  $k$  is the wave-number and  $Q^k(x)$  is the eigenfunctions of the covariant derivative. Wave-number  $k$  represent the order of harmonic oscillator and relate with the scale factor as  $k = \frac{2\pi a}{\lambda}$ , where  $\lambda$  is the wavelength of the perturbations.

2<sup>nd</sup> order evolution equation

$$\begin{aligned}
\ddot{\Delta}_m^k = & - \left( \frac{f''\dot{T}}{f'} + \left( \frac{2}{3} - c_s^2 \right) \theta \right) \dot{\Delta}_m^k + \left[ \left( \frac{3\rho_m}{2f'} + \frac{3w\rho_m}{f'} \right) (1+w) \right. \\
& - \frac{2\theta^2}{3} (c_s^2 - w) - \frac{c_s^2}{f'} (1+3w)\rho_m + \frac{f''}{2f'} \dot{T}\theta (c_s^2 + 2w) - \frac{k^2}{a^2} c_s^2 \left. \right] \Delta_m^k \\
& + \left[ \frac{\rho_m f''}{2f'^2} + \frac{3w f''}{2f'^2} \rho_m + \frac{f'''}{f'} \dot{T}\theta + \frac{f''^2}{f'^2} \dot{T}\theta \right] (1+w) \mathcal{F}^k + \frac{f''\theta}{f'} (1+w) \\
& + \left[ \frac{\theta^2}{3} - \frac{1}{2f'} (1+3w)\rho_m + \frac{2f''}{f'} \dot{T}\theta - \frac{k^2}{a^2} \right] w \varepsilon^k + \frac{f''\theta}{f'} \dot{T} c_s^2 \varepsilon^k \quad (1)
\end{aligned}$$

$$\ddot{\mathcal{F}}_r^k = \frac{\ddot{T}}{\dot{T}} \mathcal{F}^k - \frac{2\ddot{T}}{1+w} c_s^2 \Delta_m^k - \frac{\dot{T}}{1+w} c_s^2 \dot{\Delta}_m^k - \frac{2\ddot{T}}{1+w} w \varepsilon^k - \frac{\dot{T}}{1+w} w \dot{\varepsilon}^k, \quad (1)$$

2<sup>nd</sup> order evolution equation

$$\begin{aligned}
\ddot{\Delta}_i^k = & \left[ \left( \frac{3\rho_m}{2f'} + \frac{3w}{2f'}\rho_m \right) (1 + w_i) + \left[ \frac{2\theta^2}{3} + \frac{1}{2f'}(1 + 3w)\rho_m + \frac{2f''}{f'}\dot{T}\theta - \right. \right. \\
& \left. \left. \frac{k^2}{a} \right] \frac{c_s^2(1 + w_i)}{1 + w} \right] \Delta_m^k - \left[ \left( \frac{f''\theta\dot{T}}{f'} + \frac{2\theta^2}{3} \right) w_i - (w_i - c_{si}^2) \left( \frac{\theta^2}{3} + (1 + 3w) \frac{\rho_m}{2f'} \right) \right. \\
& \left. + \left( \frac{f''\theta\dot{T}}{f'} + \frac{2\theta^2}{3} \right) \frac{c_s^2}{1 + w_i} \right] \Delta_i^k - \left[ \left( \frac{f''\dot{T}}{f'} + \frac{2\theta}{3} \right) - \frac{1 + w_i}{1 + w} \theta c_s^2 \right] \dot{\Delta}_m^k \\
& + \left[ \frac{\rho_m f''}{2f'^2} + \frac{3w f''}{2f'^2} \rho_m + \frac{f'''}{f'} \dot{T}\theta + \frac{f''^2}{f'^2} \dot{T}\theta \right] (1 + w_i) \mathcal{F}^k + \frac{f''}{f'} \theta (1 + w_i) \dot{\mathcal{F}}^k \\
& + \left[ \frac{f''\dot{T}\theta}{f'} \frac{(1 + w_i)c_s^2}{1 + w} - \left( \frac{f''\theta\dot{T}}{f'} + \frac{2\theta^2}{3} \right) w + \left( \frac{f''\theta\dot{T}}{f'} + \frac{2\theta^2}{3} \right) \frac{1 + w_i}{1 + w} w \right] \varepsilon^k \\
& + \left( \frac{f''\dot{T}}{f'} + \frac{2\theta}{3} \right) (1 + w_i) \frac{k^2}{a} V^i - \frac{k^2}{a^2} \frac{w(1 + w_i)\varepsilon}{1 + w}
\end{aligned}$$

$$\begin{aligned}
 \dot{V}_{ij}^k &- (3c_{si}^2 - 1) \frac{\dot{\theta}}{3} V_{ij}^k - (3c_{si}^2 - 1) \frac{\theta}{3} \dot{V}_{ij}^k - (c_{si}^2 - c_{sj}^2) \dot{\theta} V_j^k - (c_{si}^2 - c_{sj}^2) \theta \dot{V}_j^k = \\
 &\frac{\theta}{3a} \left[ c_{si}^2 S_{ij}^k + (c_{si}^2 - c_{sj}^2) \frac{\Delta_j^k \rho_j}{h_j} + \frac{1}{h_i} p_i \epsilon^k - \frac{1}{h_j} p_j \epsilon^k \right] - \frac{1}{a} \left[ c_{si}^2 \dot{S}_{ij}^k + \right. \\
 &(c_{si}^2 - c_{sj}^2) \frac{\Delta_j^k \dot{\rho}_j}{h_j} + (c_{si}^2 - c_{sj}^2) \frac{\dot{\Delta}_j^k \rho_j}{h_j} - (c_{si}^2 - c_{sj}^2) \frac{\Delta_j^k \rho_j \dot{h}_j}{h_j^2} + \frac{1}{h_i} \dot{p}_i \epsilon^k \\
 &\left. + \frac{1}{h_i} p_i \dot{\epsilon}^k - \frac{\dot{h}_i}{h_i^2} p_i \epsilon^k - \frac{1}{h_j} \dot{p}_j \epsilon^k - \frac{1}{h_j} p_j \dot{\epsilon}^k + \frac{\dot{h}_j}{h_j^2} p_i \epsilon^k \right], \\
 \ddot{S}_{ij}^k &= -\frac{\theta k^2}{3a^3} V_{ij}^k + \frac{k^2}{a^3} \dot{V}_{ij}^k.
 \end{aligned}$$

## Growth of matter in Radiation-Dominated Universe

- In this regard, we found the solution of the second-order component equations (19) and (20) to analysis the growth of energy density in  $i^{th}$  component fluids.
- Indeed, they are many component fluids in the entire Universe and in this work, we also consider Universe has radiation and dust with torsion fluid are the major components of non-interact fluids.

## Radiation Dominated Universe

The solution for radiation dominated universe in short wavelength limit

$$\Delta_d^k(z) = C_1 \left(1+z\right)^{\frac{-296n^2+433n-72}{288n^2-360n}} \text{BesselJ} \left( \frac{l}{576n^2-720n'} \frac{2}{3} \frac{\sqrt{3}\pi}{\lambda (1+z)^2} \right)$$

$$C_2 \left(1+z\right)^{\frac{-296n^2+433n-72}{288n^2-360n}} \text{BesselY} \left( \frac{l}{576n^2-720n'} \frac{2}{3} \frac{\sqrt{3}\pi}{\lambda (1+z)^2} \right).$$

where  $l^2 = 39616n^5 + 165376n^4 - 2282560n^3 + 3048913n^2 - 1156752n + 5184$

## Short-Wavelength modes

**Figure 4:** The growth of dust fluctuations  $\delta(z)$  versus  $z$  for Eq. (20) in the radiation dominated Universe, for short-wavelength mode at  $n = 0.5$  and for different wavelength  $\lambda$

## Short-Wavelength modes

**Figure 5:** The growth of dust fluctuations  $\delta(z)$  versus  $z$  for Eq. (20) in the radiation dominated Universe, for short-wavelength mode at  $n = 0.6$  and for different wavelength  $\lambda$

## Long-Wavelength limit

Figure 6: The growth of dust fluctuations  $\delta(z)$  versus  $z$  for Eq. (??) in the radiation dominated Universe for  $n$  is closer to 0.5

## Long-wavelength limit

**Figure 7:** The growth of dust fluctuations  $\delta(z)$  versus  $z$  for Eq. (??) in the radiation dominated Universe for long-wavelength mode for different  $n$  values.

## Conclusions

- The multi-fluid system, the perturbations evolution equations are examined,
- The scalar and harmonic decomposition techniques are applied.
- We apply the quasi-static approximation is implemented to examine the growth of the density contrast with cosmic-time.
- We further investigated the growth dust density contrasts in the radiation epoch.
- From the results, we conclude that the contributions of torsion is large enough for the formation of large-scale structure.
