## Direct projectile break-up of $^{12}\text{C}$ at 33.3 MeV/nucleon.

The binary breakup of  $^{12}\text{C}$  into  $^8\text{Be}$  fragments and alpha particles were measured in coincidence in the interaction of 33.3 MeV/nucleon  $^{12}\text{C}$  projectiles with  $^{197}\text{Au}$ ,  $^{93}\text{Nb}$  and  $^{12}\text{C}$  target nuclei. Preliminary experimental cross-section contributions are extracted for both quasi-elastic and the inelastic break-up processes.
