We consider a known circuit consisting of two distant nitrogen-vacancy-center ensembles coupled to separate transmission line resonators, which interact by means of a current biased Josephson junction. Our investigation is focused on transitions and dissipation in the Josephson junction leading to entanglement. In our approach the Josephson junction is regarded as a reservoir, whose variables are eliminated from the system dynamics. We include in this scheme also superconducting quantum interference devices, flux-driven Josephson parametric amplifiers, which are the sources of a squeezed microwave field. The entanglement was studied in terms of the logarithmic negativity. The logarithmic negativity was considered for different regimes: weak coupling and strong coupling of transitions of the Josephson junction, and under action of squeezed microwave fields. We show that different degrees, time and duration of entanglement can be reached for various parameters choices.

**Apply to be considered for a student award (Yes / No)?**

Yes

**Level for award (Hons, MSc, PhD)?**

PhD

**Main supervisor (name and email) and his / her institution**

Francesco Petruccione, Petruccione@ukzn.ac.za, National Institute for Theoretical Physics, University of KwaZulu-Natal

**Would you like to submit a short paper for the Conference Proceedings (Yes / No)?**

Yes

**Primary author:** Dr TEPER, Natalia (University of KwaZulu-Natal, National Institute for Theoretical Physics)

**Co-authors:** Prof. PETRUCCIONE, Francesco (UKZN); Dr SINAYSKIY, Ilya (University of KwaZulu-Natal and National Institute for Theoretical Physics); Mr MBENZA, Lucien Nzuzi (University of KwaZulu-Natal)

**Presenter:** Dr TEPER, Natalia (University of KwaZulu-Natal, National Institute for Theoretical Physics)

**Session Classification:** Theoretical

**Track Classification:** Track G - Theoretical and Computational Physics
