## Pt -Al203 nanocoatings for high temprature concentrated solar thermal power applications

Wednesday, 13 July 2011 17:00 (2 hours)

Nano-pahsed structures based on metal-dielectric composites also called cermets (Ceramic-Metal) are considered among the most effective spectrally selective solar absorbers. For high temperature applications (stable up to 650°C) noble metals nanoparticles and refractory oxide host matrices are ideal as per their high temperature chemical inertness and stability: Pt/Al2O3 cermet nano-composites are a representative family. This contribution reports on the optical properties of Pt/Al2O3 cermet nano-composites deposited in a multilayered tandem structure. The radio-frequency sputtering optimized Pt/Al2O3 solar absorbers consist of stainless steel substrate/ Mo coating layer/Pt-Al2O3/ protective Al2O3 layer and stainless steel substrate/ Mo coating layer /Pt-Al2O3 for different composition and thickness of the Pt-Al2O3 cermet coatings. The coatings microstructure, morphology, composition, optical properties were analyzed by x-ray diffraction, atomic force microscopy, infrared attenuated total reflection and UV-VI-NIR specular reflectances.

Level (Hons, MSc, <br>> &nbsp; PhD, other)?

PhD

Consider for a student <br/> &nbsp; award (Yes / No)?

No

Would you like to <br > submit a short paper <br > for the Conference <br > Proceedings (Yes / No)?

No

Primary author: Ms NURU, Zebib Yenus (iThemba LABS)

Co-authors: Prof. CHRISTOPHER, Arendsen (University of Western Cape); Prof. MALIK, Maaza (iThamba

labs)

**Presenter:** Ms NURU, Zebib Yenus (iThemba LABS)

Session Classification: Poster1

Track Classification: Track A - Condensed Matter Physics and Material Science
