Time-domain Terahertz Spectroscopy: Principles and applications

Thursday, 14 July 2011 13:45 (15 minutes)

Time-domain terahertz (TD-THz) spectroscopy has emerged as a valuable tool for studying material properties in the THz region of the electromagnetic spectrum. Many classes of materials exhibit characteristic absorption signatures in this previously unstudied portion of the electromagnetic spectrum. This opens up the possibility for non-destructive and non-invasive testing and analysis of materials which previously have proven difficult. Time domain THz spectroscopy entails measuring the electric field of the generated THz pulse in the time domain, and extracting the spectral information from the pulse through a Fourier Transform. Two main mechanisms for generating short, broadband THz pulses have emerged namely optical rectification in a nonlinear crystal of a femtosecond laser pulse and THz generation from a photo-conductive antenna (PCA). Recently, a photo-conductive antenna TD-THz setup has been established at the Laser Research Institute, University of Stellenbosch. This presentation will focus on the basic principles of operation and on the layout of the setup as well as the possible applications envisaged using the setup.

**Level (Hons, MSc,
 PhD, other)?**

other

**Consider for a student
 award (Yes / No)?**

No

**Would you like to
 submit a short paper
 for the Conference
 Proceedings (Yes / No)?**

No

Primary author: Dr NEETHLING, Pieter (Laser Research Institute, University of Stellenbosch)

Co-authors: Dr STEENKAMP, Christine (Laser Research Institute, University of Stellenbosch); Prof. ROHWER, Erich (Laser Research Institute, University of Stellenbosch); Ms NUMAN, Nagla (Laser Research Institute, University of Stellenbosch)

Presenter: Dr NEETHLING, Pieter (Laser Research Institute, University of Stellenbosch)

Session Classification: LOS

Track Classification: Track C - Lasers, Optics and Spectroscopy
