Type: Oral Presentation

Numerical Modelling of experiments performed at the OPAL research reactor

Tuesday, 4 July 2017 14:40 (20 minutes)

The IAEA is currently administering an international Coordinated Research Project (CRP), the main purpose of which is to develop a set of research reactor benchmarks for the verification and validation of computational codes. The focus of the CRP in particular is the modelling of multi-cycle depletion. Necsa has recently developed a new calculational framework for performing nuclear reactor core calculations, which integrates both the stochastic and deterministic modeling methods in a consistent manner. In this work, the system is applied to the OPAL benchmark problem.

The OPAL reactor is a modern research reactor with challenging aspects in neutronic design. In particular, the use of burnable poisons and a heavy water reflector poses modeling challenges. Analysis conducted on this benchmark includes control rod calibration experiments as well as the simulation of seven actual operating cycles.

Apply to be
 considered for a student
 award (Yes / No)?

No

Level for award
 (Hons, MSc,
 PhD, N/A)?

N/A

Would you like to
> submit a short paper
> for the Conference
> Proceedings (Yes / No)?

Yes

Primary author: Ms MUDAU, Rotondwa (Necsa)

Co-authors: Ms BOTES, Danniell (Necsa); Mr VAN HEERDEN, Francois (Necsa)

Presenter: Ms MUDAU, Rotondwa (Necsa)

Session Classification: Applied Physics

Track Classification: Track F - Applied Physics
